Conference Title: Proceedings of the 22nd Annual International Conference of the IEEE Engineering in Medicine and Biology Society

Conference Date: 23-28 July 2000 Conference Location: Chicago, IL, USA

Language: English Document Type: Conference Paper (PA)

Treatment: General, Review (G)

Abstract: Summary form only received as follows: The Health Care System in Mexico includes the hospitals for the population that has no social security, which are 400, plus many primary clinics. In October 18th, a project to evaluate the Y2K process in those hospitals began. The contractor proposed 10 weeks using 16 biomedical engineers to get the information and render recommendations. The inventories and information analysis for the 400 hospitals required 35 biomedical engineers during 3 weeks in November 1999. They had to visit 32 different states, interview the Y2K project manager and do a specialized inventory in 183 hospitals. The rest of the hospitals, with less number of equipment, sent their inventories by fax or mail. The analysis led to a total of 3,670 medical equipment. The process of analyzing each equipment status regarding Y2K was done during December. Four full time engineers and 22 clinical engineers, who helped after 5 p.m. (weekends and weeknights), finally processed all the information. Consults with distributors or the web were done. The final database was of 1226 different types of equipment, which were classified into 4 priorities and sent to every state with the information of each of their hospitals, with recommended actions to take either before, in the transition or during year 2000. After this challenge, the authors know that clinical engineers in Mexico can work together for a goal and they hope for another opportunity. The project described in this abstract was supported by a grant from the Health Ministry. (0 Refs)

Conference Title: Proceedings of 33rd Annual URISA Conference
Conference Date: 16-20 July 1995 Conference Location: San Antonio, MN, USA

Language: English Document Type: Conference Paper (PA)

Treatment: Practical (P)

Abstract: Business needs require flexibility and responsiveness and the correct data application is essential. A geographic information system (GIS) is often the solution for meeting the unique needs of the various business units by eliminating the potential duplication of records needed by departments in widespread locations, by reducing error due to incorrect versions of maps and their related geographic attributes, by increasing the communication between users and by decreasing individual computer applications development in multiple departments which meet only very specific needs. Building a GIS through diverse intra-company partnerships will best meet the corporate goals and benefit the individual departments through sharing of technology, data and costs. (0 Refs)

This report describes the status of MicroPAVER implementation at the airports included in the Texas Aeronautical Facilities Plan. In 1998, the research team inspected 41 airports with 56 runways, 54 primary aprons, and 62 primary taxiways. To date, 245 airports have been inspected and the resulting information entered into the MicroPAVER database. For this report, the aprons and taxiways were inspected, but the data was not entered. The list of airports is included in Table 1. The runways at all

245 airports have been inspected and the resulting information entered into the MicroPAVER database . Aprons and taxiways have been inspected at nearly 80 of these airports.

Descriptors: *Runways; *Pavement damage; *Texas; Inspection; Cracks; Pavement condition; Airports; Surveys; Computer applications

Abstract (Basic): US 20040260646 A1

NOVELTY - The system has a merchant system (130) communicating with a transaction device e.g. fob (102), to receive proxy account identifier with an account identifier portion. The identifier is linked with a transaction account. The merchant system receives the portion and provides related identifier, where the merchant system provides the identifier to an account identifier provider server for transaction completion.

DETAILED DESCRIPTION - An INDEPENDENT CLAIM is also included for a method of transmitting data for transaction completion.

USE - Payment system.

ADVANTAGE - The system eliminates the cost associated with involving a third-party server to translate the account fob data into a merchant recognizable format e.g. magnetic stripe.

DESCRIPTION OF DRAWING(S) - The drawing shows a RFID-based system, where components used for fob transaction completion are depicted.

Fob (102)
RFID reader (104)
POS device (110)
Customer interface (118)

Abstract (Basic): KR 2004079204 A

NOVELTY - A security system of an electronic bankbook and a method thereof are provided to prevent the data forgery of a banking transaction system using the electronic bankbook and easily discriminate the illegally copied electronic bankbook.

DETAILED DESCRIPTION - A bank server(20) transmits/receives data with a terminal(40) through the network(50). A ledger database(22) stores an MAC(Message Authentication Code) generated for each banking transaction by linking with transaction record data. An MAC generator(24) generates the MAC by using the transaction record data generated for each banking transaction and an MAC generation password assigned to each account as an operation factor under control of the bank server. A card recorder(42) reads or writes the data to the electronic bankbook(30). The terminal makes the card recorder transmit the data read by the card recorder to the bank server through the network, and stores the MAC received from the bank server to the account information by linking with the transaction record data. The electronic bankbook stores the transaction record data, the MAC, and the account information.

NOVELTY - An instruction is transmitted from the merchant server
(M) to an account server (AS) upon receipt of a transaction request
confirmation (1). A direct communication link is established between
the customer terminal (C) and account server for customer
verification and payment processing. The security data is transmitted
from the customer terminal to the account server for customer
recognition and verification.

DETAILED DESCRIPTION - INDEPENDENT CLAIMS are also included for the
following:

- (1) a security device;
- (2) an account server; and
- (3) a merchant server.

USE - For purchase transaction processing e.g. for internet
shopping, and also shopping at retailer's premises using computer,
personal digital assistant (PDA), mobile phone, etc.

ADVANTAGE - Provides comprehensive security for customer data.
Helps to prevent fraud on merchants and allows convenient shopping by
the customer.

DESCRIPTION OF DRAWING(S) - The figure shows the signals for
completion of the transaction processing method.

KR 2004055753	A	1	G06F-017/60	

Abstract (Basic): KR 2004055753 A

NOVELTY - A method for offering cyber division accounts and processing settlement is provided to make the slave clients having no cyber bank account get/use the cyber division account on the Internet by making a master client receive a plurality of cyber division account through the bank account of the master client.

DETAILED DESCRIPTION - A bank server receives the bank account information and the slave client information from the master client(805). The bank server provides the cyber division account to the master client(820). The bank server generates the cyber division account information of each slave client by linking the slave client information with the issued cyber division account information. The bank server stores the cyber division account of each slave client in a database by linking with the bank account information of the master client(845). When the slave client uses the cyber division account, the slave client offers the cyber division account information to an Internet web site. The web site transmits the cyber division account to the bank server. The bank server processes the settlement through the bank account of the master client.

Abstract (Basic): US 20040133511 A1

NOVELTY - The method involves distributing a stored value card to a
merchant for distribution to a customer having an account with a
specific provider. A request is received to activate the card from a
merchant terminal. A processor receives a redemption request from the
customer. The provider and account number is identified and a request
to apply the associated stored value is passed from the central
processor to the provider.

DETAILED DESCRIPTION - The stored-value card has an associated
identifier that can be used to associate a stored value with the card,
the associated stored value being redeemable with one or more
providers, including the specific provider, the account having an
associated account number.

An INDEPENDENT CLAIM is also included for system for adding

stored value to a customer account .

USE - Used for processing a stored-value card e.g. prepaid long distance phone card, request in wireless telecommunication service provider.

ADVANTAGE - The method provides single payment card, thereby enabling a customer to iteratively add value to stored-value account. The method streamlines the process of activating a PIN because customer is not transferred from the central processor to a third party provider's system. The central processor can manage stored-value card activations for many customers with many different service providers, hence offers promotions and monitor consumer behaviors across a large and diverse market segment. The card has rechargeable card feature, and hence enables customers to use a single card and PIN for adding value at a merchant terminal rather than purchasing and activating new cards.

DESCRIPTION OF DRAWING(S) - The drawing shows a flowchart showing a method for supplying communication service value.

Abstract (Basic): CN 1471297 A

NOVELTY - The system comprises the sound information service system, network account management system and personal account server. The sound information service system comprises the sound device and transaction server. The sound information service system sends transaction signal including the transaction unit to the network account management system. Based on the transaction signal, the network account management system adds the value to personal account in personal account server. The characters are that network account management system comprises the adding value server and the checking and verifying control server, which creates random character string. The transaction log is stored in transaction server and adding value server. Random character string is included in a log of each transaction unit. Random character string is as verification symbol of valid transaction. The invention provides fast and convenient network means of payment with high safety.

NOVELTY - The system (10) has a CD-ROM (26) to store information for connecting customer's system (12) to sales trader's system (14), real estate sales information and link information. The trader's system records the customer information, when customer in connection with the trader's system, is identified. The housing and notification information of the customers are unified, and details about real estate are provided to a customer.

DETAILED DESCRIPTION - An INDEPENDENT CLAIM is also included for computer readable recorded medium storing real estate purchasing and managing program.

USE - Real estate purchasing and managing system.

ADVANTAGE - The real estate is purchased according to the own taste by reliable communication of the sales traders with the customers, thereby the customer's purchasing volition is increased.

DESCRIPTION OF DRAWING(S) - The figure shows the block diagram of the real estate purchasing and managing system. (Drawing includes non-English language text).

KR 2003052527 A 1 G06F-017/60

Abstract (Basic): KR 2003052527 A

NOVELTY - A system for a financial transaction service using electronic money is provided to set a virtual account to a client who joins to a P2P system and charge electronic money to the virtual account.

DETAILED DESCRIPTION - An account creation unit(212) creates a virtual account corresponded to a wireless terminal identifier of the client(100) connected through a wire/wireless network(150). A user DB stores the wireless terminal identifier, virtual account information, an actual account set in a bank server(300), and electronic money charged in the virtual account. An account managing unit(214) creates transfer information, transmits the created transfer information to the bank server(300) having a client actual account(300/1-300/n), and instructs an account transfer between the actual account and a pre-set account. When the bank server(300) executes an account transfer between the actual account and a pre-set account in accordance with the transfer information, the account managing unit(214) adds or subtracts electronic money stored in the user DB, and charges or exchanges electronic money information.

Abstract (Basic): US 20020116304 A1

NOVELTY - A party file has party records containing information related to parties. An account file has account records containing a link to at least one of the party records. A transaction file has transaction records containing a link to at least one of the account records.

DETAILED DESCRIPTION - INDEPENDENT CLAIMS are included for the following:

- (1) Method for managing transactional information;
 - (2) Method of determining risk associated with transactions stored in a system; and
 - (3) Computer implemented transaction information management method.
- USE - For management of financial account information in financial institution.

ADVANTAGE - As the party file, account file and transaction file are linked, data maintenance becomes more efficient and simple. Improves accuracy and consistency of party information stored in party file, thereby increasing reliability of data analysis such as risk analysis and profitability analysis that requires accurate and consistent information.

DESCRIPTION OF DRAWING(S) - The figure shows the flow diagram for evaluating the risk associated with transactions.

Abstract (Basic): US 20020077990 A1

NOVELTY - Postage and authentication information of a transaction record are combined with an indicator to create a modified postage indicium, on receiving a request to reissue the original indicium. The modified indicium is dispensed from a postage meter so that the indicator in the dispensed indicium identifies that the dispensed indicium is a reissue of the original indicium.

USE - For reissuing postage indicium such as US postage in a PC-based postage metering system.

ADVANTAGE - Easily detects fraudulent reissue of indicium by examining the transaction records.

DESCRIPTION OF DRAWING(S) - The figure shows a schematic block diagram of the DLL in the PC-based metering system.

Abstract (Basic): WO 9715023 A

The sales process support system for large financial organisations is based around a large central database (10). This has links to account opening systems to record new customers and accounts. It also has feeds from a variety of other sources, e.g. bank cards, demographics, telephone numbers etc. It stores and maintains consistent information on all customers and possible sales leads.

It has connections to remote micromarketing workstation centres. These workstations are provided with a graphical interface to simplify the task of forming database enquiries that can be used to generate sales leads.

ADVANTAGE - Provides a consistent and wide ranging access to sales lead generation processes.

ABSTRACT

PROBLEM TO BE SOLVED: To provide an m-commerce system requiring no transfer of the information concerning a customer.

SOLUTION: This m-commerce system 100 stores a virtual bank account for each customer joined in the system. The account shows the payability of the customer. This system also stores information on customers and sellers joined to the system. This system receives the inquiry for payability sent by a seller through a mobile communication network. In reply to this inquiry, the m-commerce system 100 checks whether the customer is payable to a purchased product or not. When the payability is judged, a commercial server 12 transmits a sales message including all details of the transaction concerned. In reply to this sales message, the m-commerce system 100 starts data processing. During this processing, the money is paid to the account of the seller and subtracted from the account of the customer, and statistical and necessary databases are renewed.

ABSTRACT

PURPOSE: To provide a data base control system and its method that improves the responsiveness to the request given to a data base.

CONSTITUTION: A data base control system consists of a processor 30 and a processor 34 which connects the processor 30 to a data base 36. The processor 30 divides the retrieving requests given to a buffer 304 which controls each record and the base 36 into the retrieving instructions given to the buffer 304 and the base 36 respectively. Thus, the data retrieved from the buffer 304 by the former retrieving instruction are added to the record given from the processor 34 in response to the latter retrieving instruction. Then, the set of the preceding data and record is defined as a response to the retrieving request.

ABSTRACT

PURPOSE: To reduce the time and the labor of a person in charge by showing automatically the necessary addition and its quantity to the revised edition of production for the printed matters to which the contents of an additional parts file are outputted.

CONSTITUTION: When the design revised edition information JSK is received from a host device 25, the contents of a reference table 19 are updated and therefore the table 19 is always kept in its latest state. While the production order information JSD received from the device 25 is added to a progress file 17 as a new code. In this case, a production ~~command~~ number is automatically ~~added~~ to the ~~record~~ based on the diagram number designated by the information JSD. Then the production order diagram registered newly into the file 17 is collated with a diagram number of the table 19. In the case the coincidence is obtained between both diagram numbers, the present revised edition is collated with the updated revised edition. As a result, the additional quantity is calculated from an equation I for the parts specifications where the present revised edition is larger than the updated revised edition in terms of the using frequency. Thus it is possible to obtain an additional parts record where the result of calculation is written into the additional quantity item of an additional parts file 18.

Abstract (Basic): US 20050081206 A1

NOVELTY - The method involves determining a critical path of thread execution based on an information exchanged between a processing unit (200) and threads (206, 208). The path is maintained in a critical path tree. Wait time during which one thread awaits a synchronization event is determined based on the information. The wait time affects the critical path or not is determined, and indicated as high priority if it affects the path.

DETAILED DESCRIPTION - An INDEPENDENT CLAIM is also included for an article of manufacture comprising a machine-accessible medium having a set of machine-accessible instructions that, when executed, causes a machine to perform a method of profiling a threaded program during program runtime.

USE - Used for profiling a threaded program during program runtime.

ADVANTAGE - The method efficiently profiles a threaded program during runtime, allows a faster execution of the program, and reduces overall run-time of the program.

DESCRIPTION OF DRAWING(S) - The drawing shows a functional diagram of a multiprocessor.

Abstract (Basic): US 20050055593 A1

NOVELTY - The method involves selecting an action from a group to acquire or release a lock. Current state of the lock is asynchronously queried and next state of the lock is speculatively determined. The lock is attempted to transition from the queried current state to the speculatively determined next state.

DETAILED DESCRIPTION - INDEPENDENT CLAIMS are also included for the following:

- (1) thread lock managing apparatus;
- (2) article comprising storage medium storing thread lock managing program; and
- (3) thread lock managing system.

USE - For managing shared resource in computer system. Also the technique is implemented in hardware, software, firmware and in programs executing on mobile or stationary computers, personal digital assistants (PDAs) and devices including processor, storage medium.

ADVANTAGE - Enables to efficiently acquire and release a shared resource through the lock semaphore.

DESCRIPTION OF DRAWING(S) - The figure shows the flowchart explaining thread lock managing method.

Abstract (Basic): US 20040044516 A1

NOVELTY - The system has an event manager to coordinate interaction between components of the system. Autonomous executable domain agents receive process and respond to a query or a command. A parser determines a domain for a user generated natural language utterance based on a content and context of the user utterance. The user generated natural language utterance is received through a speech unit.

DETAILED DESCRIPTION - An INDEPENDENT CLAIM is also included for a method responsive to a user generated natural speech utterance.

USE - Used for natural human query response interaction between human and machine.

ADVANTAGE - The system provides an environment that makes maximum use of context, prior information, domain knowledge, and user specific profile data.

DESCRIPTION OF DRAWING(S) - The drawing shows an overall diagrammatic view of a natural language speech utterance responsive system.

Abstract (Basic): US 20040025164 A1

NOVELTY - The method involves performing a resource operation related to mutually exclusive shared resources (120) by a multi-threaded program (110). The relationships created by the operation between the threads in the program and the shared resources are monitored by a resource operation monitoring mechanism (130). The deadlocks in the program are detected based on the relationships between the threads and the shared resources.

DETAILED DESCRIPTION - INDEPENDENT CLAIMS are also included for the following:

(1) a system for detecting deadlocks

(2) an article storing instructions that are executed for detecting deadlocks.

USE - Used for detecting deadlocks in multi-threaded program.

ADVANTAGE - The deadlocks in the multithreaded program are detected based on the relationships between the threads of the program and the shared resources, thereby providing an efficient way to solve the deadlocks within less time and making the resources available for sharing.

DESCRIPTION OF DRAWING(S) - The drawing shows a framework in which deadlocks among threads in a multithreaded program are monitored and detected.

US 6593940	B1	30	G06F-011/00	CIP of application	US 98220735

Abstract (Basic): US 6593940 B1

NOVELTY - The method involves inserting an opcode within a multi-program to generate an annotated memory trace address. Locks of the program are identified at the instant when two or more threads access the same lock is detected. Ordered nature of previous and current access are determined and a race defect is indicated when the access are not ordered. The results of the analysis are displayed using a graphical interface.

DETAILED DESCRIPTION - An **INDEPENDENT CLAIM** is also included for a machine-readable medium having stored instructions to perform the multi-threaded program threading defects detecting method.

USE - Used for detecting threading defects in multi-threaded programs.

ADVANTAGE - The method produces the places and kinds of defects detected during the execution of the program, and permits quick and efficient resolution of defects in the program. The method utilizes a dynamic analysis system that does not need to make conservative assumptions since the act of executing the program generates the exact behavior of the program.

DESCRIPTION OF DRAWING(S) - The drawing shows a flow chart of the operation of a method for finding errors in multi-threaded applications.

Patent Details:

Patent No	Kind	Lan Pg	Main IPC	Filing Notes
US 20030097395	A1	13	G06F-009/00	

Abstract (Basic): US 20030097395 A1

NOVELTY - A set of task stacks associated with corresponding thread is created and task on the primary stack is executed by the primary thread. A queried task in the secondary task stack is identified and the queried task is executed by the primary based on the existence.

DETAILED DESCRIPTION - INDEPENDENT CLAIMS are also included for the following:

(1) machine readable medium storing task execution instructions;

and

(2) task execution apparatus

USE - For executing tasks in parallel computer system.

ADVANTAGE - Enables maintaining the system efficiency by allowing the execution of task depending on dynamic execution time.

DESCRIPTION OF DRAWING(S) - The figure shows the flow chart indicating task execution.

US 20030066056	A1	15	G06F-009/45	

Abstract (Basic): US 20030066056 A1

NOVELTY - A source code written in specific language such as C/C++, and comprising global storage objects such as unions, are translated into another code by adding initialization logic for each of the global storage objects. The addition of initialization logic is performed by generating private copies and associated pointers for the global storage objects.

DETAILED DESCRIPTION - INDEPENDENT CLAIMS are also included for the following:

- (1) code compilation and execution system; and
- (2) machine readable medium storing code compilation and execution program.

USE - For accessing thread-privatized global storage objects in C/C++ language, Fortran, Java and Pascal in multi-threaded environment.

ADVANTAGE - By exporting a copy of a data structure which is internal to a run time library, into the program units of the code, the run time speed and performance of the code are increased.

DESCRIPTION OF DRAWING(S) - The figure shows a flowchart of the compilation and execution process.

Patent Details:

Patent No Kind Lan Pg Main IPC Filing Notes
US 20030061255 A1 14 G06F-009/00

Abstract (Basic): US 20030061255 A1

NOVELTY - A code segment having set of instances of parallel construct is received and translated to another code to perform predetermined task. A shared value that indicate most current set of instances and private value that indicate one of the set of instances encountered by threads are allocated. The shared and private values are maintained by incrementing the values, when thread undertakes task corresponding to instances.

DETAILED DESCRIPTION - INDEPENDENT CLAIMS are also included for the following:

- (1) parallel computing apparatus;
- (2) parallel computing system; and
- (3) computer-readable medium storing parallel computing program.

USE - For performing parallel computation in shared memory architectures.

ADVANTAGE - The number of lock acquisitions is decreased, by maintaining the shared and private values, thereby the number of potential cache misses are decreased and the memory is utilized efficiently.

DESCRIPTION OF DRAWING(S) - The figure shows the flowchart explaining the parallel computation process.

US 6792599 B2 G06F-009/45

Abstract (Basic): US 20030074649 A1

NOVELTY - The method involves translating a received program unit into another program unit if the data size of an operand included in

the memory update operation of the program unit is supported by a set of low-level instructions, to associate a memory update operation with the set of low-level instructions and ensure atomicity of the memory update operation.

DETAILED DESCRIPTION - INDEPENDENT CLAIMS are also included for the following:

- (a) a parallel computer apparatus; and
- (b) a machine-readable medium.

USE - For computer processing.

ADVANTAGE - Enables implementation in any suitable computer system having suitable integrated circuits. Enables efficient atomic operations to be implemented across multiple platforms while optimizing performance of each platform. Provides ability to tailor performance and explore performance and implementation cost trade-offs on each platform. Enables low-level instruction sets to fully support spectrum of operations, data types and data type sizes on individual platform.

DESCRIPTION OF DRAWING(S) - The figure is a flowchart for translating an atomic operation.

Abstract (Basic): WO 200189924 A2

NOVELTY - A merchant process server appends a merchant processing

request to customer accounts to produce merchant processing request data file. A process server compares the data file with a merchant's customer database, to produce a comparison data file which has records including compilation of accepted/rejected requests respectively. The process server updates database according to the merchant processing request data file.

DETAILED DESCRIPTION - An INDEPENDENT CLAIM is also included for merchant customer account database updating method.

USE - In banks, utilities, service organizations, service stores, for updating the customer account database through computer network such as Internet, intranet, LAN, WAN, extranet, telephone network, satellite communication, kiosk, point-of-sale equipment, cellphone, personal digital assistant, online communication and offline communication.

ADVANTAGE - Automatically updates the customer database in response to changes made to the customer's transaction account information or credit card privilege status and enables managing remote database information.

DESCRIPTION OF DRAWING(S) - The figure shows the flowchart explaining the process for performing provider change both transaction.

Abstract (Basic): US 6286130 B1

NOVELTY - The method involves translating an input parallel program into a sequential computer program. The sequential computer program is executed to detect and report the semantic inconsistencies between the parallel computer program and its corresponding sequential computer program.

DETAILED DESCRIPTION - An INDEPENDENT CLAIM is also included for a system for detecting errors in a parallel computer program by translating a parallel computer program into a sequential computer program.

USE - Used for detecting individual errors in a parallel computer program by translating a parallel computer program into a sequential

computer program.

ADVANTAGE - Enables automatically validating the correctness of parallel computer programs by identifying semantic differences between parallel computer programs and their corresponding sequential programs that would cause the parallel computer programs to behave differently or to produce different results when compared to the corresponding sequential programs. Reports semantic inconsistencies with respect to programmer level constructs in the source code of parallel programs, and supports separate compilation of various procedures in the programs. Performs a validation that is portable across various types of computer systems and independent of attributes of particular computer system. Enables analysis of a complete, parallel programming language dialect independent of the particular parallel programming language used.

DESCRIPTION OF DRAWING(S) - The figure shows the overall structure and flowchart of the detection method..

Patent Details:

Patent No	Kind	Lan	Pg	Main IPC	Filing Notes
US 5812852	A		20	G06F-009/45	

Abstract (Basic): US 5812852 A

The method involves describing global storage objects to be privatised by a privatisation specification (110) based on which a parallel computer program (100) is augmented via a translator (120) to produce a translated parallel computer program (130). The translated program thus produced is linked with a runtime support library (140) by a general purpose computer's linker (150) to produce an executable parallel computer program (160) which accesses the global storage objects in a privatised manner. The above process is repeated for each of the global storage objects to be privatised.

ADVANTAGE - Facilitates accessing of specified global storage object in privatised manner without requiring any user modifications to input parallel computer program. Supports separate compilation of various procedures of parallel program.

Zero latency data transfer for disc drive controller - comparing sector
identification bytes while sector number is written for storage in table
look-up with buffer address for data storage
Patent Assignee: WESTERN DIGITAL CORP (WDIG-N)
Inventor: BONKE C; CRUZ A
Number of Countries: 001 Number of Patents: 001
Patent Family:
Patent No Kind Date Applicat No Kind Date Week
US 4918651 A 19900417 US 88220535 A 19880718 199020 B

Priority Applications (No Type Date): US 88220535 A 19880718

Abstract (Basic): US 4918651 A

A zero latency read is accomplished under the control of a state machine by reading and comparing cylinder, high cylinder low and SDH bytes from capture circuitry and a task file. Positive comparison of these three bytes will result in a transfer enable command from the machine to the data transfer circuit and a sector register write

command to the sector register of the task file, thus writing the incoming sector number in the capture circuit into the task file sector register.

Data is then read from the sector to the buffer memory and the microprocessor maps sector number with buffer address. Each sector from the entire track is read in the fashion until all sectors on the track have been completed. Data is then transferred to the host computer under control of the microprocessor in the desired sector order.

ADVANTAGE - Reads data from track on data disk with no latency in initiation of data transfer due to sector alignment. (11pp Dwg.No.7/8)
Title Terms: ZERO; LATENT; DATA; TRANSFER; DISC; DRIVE; CONTROL; COMPARE; SECTOR; IDENTIFY; BYTE; SECTOR; NUMBER; WRITING; STORAGE; TABLE; UP; BUFFER; ADDRESS; DATA; STORAGE

Effective database marketing

Tucker, Robert; Brown, Neil

Incentive v168n12 PP: 52-53 Dec 1994 CODEN: ICTMBW ISSN: 1042-5195

JRNL CODE: IMK

DOC TYPE: Journal article LANGUAGE: English LENGTH: 2 Pages

WORD COUNT: 775

ABSTRACT: A 3-point blueprint to help a first time database marketer (DBM) is presented. DBM begins with building the customer/prospect list from various sources, including internal records or historical data, often captured by accounting or operations systems. The next step is segmenting customers and prospects into various classifications. Profiling identifies frequencies (percentages) of different categories. Scoring ranks segments or individual customers by some predetermined criteria, often sales or gross-margin contribution. Modeling employs statistical techniques like multiple regression, which segments data through a series of variables to identify factors that correlate to high sales potential or likelihood of promotional response. Armed with detailed customer and market analysis, the next step is the execution of marketing, sales and communications programs. At least 5 key DBM strategies exist: 1. new customer acquisition, 2. customer penetration, 3. customer retention or reactivation, 4. measuring results, and 5. customer intelligence.

TEXT: Despite the high interest in database marketing (DBM), many business marketers have not implemented a DBM plan. One reason for this is a lack of practical information about DBM. Here's a three-point blueprint to help a first timer develop an effective plan.

STEP 1:

Building the List

DBM begins with building the customer/prospect list from various sources, including internal records or historical data, often captured by accounting or operations systems. External information, available through list providers, credit bureaus and other sources, is often "match coded" to customer records and then "appended" to these records (a process commonly referred to as enhancement). Telemarketing or sales input is often helpful in qualifying contact names and ensuring accuracy.

STEP 2:

Segmentation

Segmenting customers and prospects into various classifications is the next step in DBM. The most basic level of segmentation involves classifying, coding or sorting customers/prospects by type, size or potential. Business marketers can utilize Standard Industrial Classifications (SIC codes) established by the federal government to categorize most business types. Other typical classifications include sales revenue, employees and product purchases.

A higher level of segmentation involves profiling, scoring or modeling of customers and prospects. Profiling identifies frequencies (percentages) of different categories: For example, "Financial services make up 17 percent of XYZ Corp.'s customer base." In addition, the 80/20 rule can be illustrated utilizing percentages: For example, "80 percent of XYZ's profits are derived from the top 20 percent of customers."

Scoring, as the name implies, ranks segments or individual customers by some predetermined criteria, often sales or gross-margin contribution.

Dividing the ranked list into three groups is common to identify heavy, moderate and light users. Mail order marketers utilize RFM, that is, recency (how recently the customer purchased a company's product), frequency, and monetary or transaction value as criteria for judging customer worth.

Modeling employs statistical techniques like multiple regression, which segments data through a series of variables to identify factors that correlate to high sales potential or likelihood of promotional response. Prospective customers can then be "fitted" to these models to determine which prospects should be priorities.

STEP 3:

Marketing, Sales and Communications Programs

Armed with detailed customer and market analysis, the next step is the execution of marketing, sales and communications programs. Depending on your objectives, at least five key DBM strategies exist:

1. New customer acquisition. Identifying and communicating with high-potential prospects is a goal of most marketers. The segmentation tools described allow you to focus on prospects that are heavy users or that fit predetermined criteria. DBM can be used to identify new customer "gains," and to track trends in new customer activity. Finally, DBM can be used to target and manage prospect communications, marketing and sales programs.

2. Customer penetration. Are you the sole supplier to your top 25 customers? If not, what is your "account penetration" level by customer? DBM can help identify penetration by comparing transaction data to total customer purchases, whether actual, forecasted or derived data (a more precise form of forecasting which predicts future purchases based upon current and past purchasing levels). In addition, modeling "ideal" product mix by customer type will identify cross-selling and up-selling opportunities. Again, the segmentation step can identify opportunities. Then DBM can serve to coordinate or manage marketing, sales and communications.

3. Customer retention or reactivation. Strategies in this area have grown in importance since the high cost of new customer acquisition has been well documented. DBM can support the identification of lost customers to be reclaimed and dormant customers to be reactivated, as well as the "lifetime value" of customers. DBM often is the foundation for implementing loyalty-building strategies, including continuity or points programs, recognition programs and other value-added marketing or sales campaigns.

4. Measuring results. Tracking of marketing, sales, advertising and communications program results is possible by "capturing" customer/prospect responses, transactions and other information in the database. Updating customer records allows the database to remain fresh. In addition, coding and sorting allows for the testing of alternative programs or offers, with responses carefully measured to support ongoing improvements.

5. Customer intelligence. Sometimes a byproduct of DBM is the ability to utilize the database as a customer intelligence device. Segmentation supports customer intelligence. Often a customer record will include unlimited text entries. This information can be used to predict future purchasing patterns of existing products and likely purchases of products not yet in the marketplace. Having access to remote databases in markets your company sells in and employing a "real-time" updating system will reinforce the effectiveness of customer intelligence applications.

Robert Tucker is president and Neil Brown is senior marketing director of Tucker Chicago Inc., a Schamburg, Ill.-based full-service marketing and communications agency.

Enterprise-wide limit minding at FNB

Anonymous

Financial Technology International Bulletin, v14, n1, p4, Sep 1996

ARTICLE REFERENCE NUMBER:

TEXT:

SOUTH AFRICA'S First National Bank has commenced work on a real-time credit limit-minding system encompassing its entire corporate and retail customer base.

The bank is installing the Ricos system, from Management Data, on an IBM MVS mainframe and DB2 database at its computer centre in Johannesburg. The turnkey implementation is scheduled for completion by December this year, and work to connect the bank's 600 branches and extensive ATM network to the core system will then begin. The complete system is expected to go live during 1997.

All customer transactions, including those performed at ATMs and those entered into using Video Bank, FNB's PC-based home banking system, will be fed into Ricos and checked against the relevant customer credit limits.

Limits for the bank's corporate customers will be maintained in the same way. The dedicated banking terminals used for corporate cash management will be linked to Ricos through FNB's customer information system, enabling up-to-the-minute credit checking on business accounts.

In total, some 3000 staff within the bank's branches will access the data through OS/2 PCs or dumb terminals, and customer limits generally will be controlled at this level. Data systems engineers are working closely with the bank's IT staff to customise the user interface so that it more closely resembles the Hogan system, which bank staff already use on a daily basis. Detailed management information is provided by **combining customer account** information from the Hogan **system** with data on customer transactions and **credit** limits generated through Ricos. The reporting facilities will be used to analyse customers' overall lending exposure and to view outstanding credits by customer, by product and by branch.

David Gelling, FNB's manager of risk control systems within the group credit division, says: 'FNB had already been working with Management Data for a number of years, having successfully installed the Corona account reconciliation system within our treasury division. When it came to selecting a credit risk system, the ability to provide credit checking in real time was a fundamental requirement. Ricos appeared to be the only system on the market which met our precise needs.'

FNB is now planning to extend the system across the group, taking in divisions in Botswana, Namibia and Swaziland, and subsidiaries such as Wesbank, a motor vehicle finance firm, and Firstcard, a credit card issuer.

Conference Title: Proceedings of 2nd ACM Conference on Computer and Communications Security

Conference Sponsor: ACM

Conference Date: 2-4 Nov. 1994 Conference Location: Fairfax, VA, USA

Language: English Document Type: Conference Paper (PA)

Treatment: Applications (A); Practical (P)

Abstract: This paper describes a communications networking technique for funds transfer which **combines** the privacy of cash **transactions** with the security, **record** -keeping and charging mechanisms of credit cards. The scheme uses a communications network and cryptographic protocols to separate information. The company that extends credit to the individual and collects the bill does not have access to the specific purchases, and the shop that sells the merchandise is convinced that it will be paid without learning the individual's identity. The information is separated to make it difficult to associate an individual with his purchases. Analysis of the information separation in this **system** shows that five parties must collude to associate an individual's identity and purchases. If an individual deposits cash into the **system**, rather than asking for credit, then none of the parties need to know his identity. Complete anonymity is obtained while retaining the security against loss or theft and the record keeping capabilities of credit cards. (25 Refs)

ABSTRACT EP 747814 A1

The present invention is a distributed computer system having a plurality of end user terminals and a plurality of loosely coupled server computers that share no resources with each other. A multiplicity of user application processes are distributed over the server computers. An Enq table is stored on a first one of the server computers. The Enq table includes Enq records, each representing a locked resource. When any user application process executes an Enq instruction naming a specific resource, if the Enq table does not already contain an Enq record for the specific resource an Enq record is generated and stored in the Enq table representing the specific resource as locked. The Enq record is stored in the same Enq table on the first server computer regardless of which server computer executes the Enq instruction. If the Enq table does already contain an Enq record for the specific resource, execution of the user application process that executed the Enq instruction is suspended. When any user application process executes a Deq instruction naming a specific resource, the corresponding Enq record, if any, is deleted. In addition, execution is resumed for any user application process that was suspended when it attempted to execute an Enq instruction on the same specific resource.

ABSTRACT EP 747832 A2

In summary, the present invention is a distributed computer system having a plurality of end user terminals and a plurality of loosely coupled server computers that share no resources with each other. A multiplicity of user application processes are distributed over the server computers. A communication interface or router transmits data between the end user terminals and a transaction router process, which executes on one of the server computers. The transaction router process initiates execution of transactions by ones of the user application processes based on data received from the end user terminals. A link manager process selects application processes to execute the applications based on computational load distribution criteria, so as to distribute computational load as evenly as possible over the server computers, thereby maximizing the throughput and responsiveness of the system. A file system, located on at least one of said server computers, provides access to stored files and database tables to all of the user application processes without regard to which server computer each such user application processes is executed on. The transaction router process includes a data structure for indicating transactions waiting to start and for initiating execution of ones of the waiting transactions by ones of the user application processes when associated start criteria are satisfied and user transaction processes are available. ABSTRACT EP 747813 A2

The present invention is a distributed computer system having a plurality of end user terminals and a plurality of loosely coupled server computers that share no resources with each other. A multiplicity of user application processes are distributed over the server computers. A temporary storage file is stored on a first one of the server computers, for temporarily storing queues of data records. Each user application process responds to execution of a WriteQ TS instruction specifying data to be stored in a specified temporary storage queue by generating and storing at least one TS data record in the temporary storage file representing the specified data. Each TS data record has a primary key indicating the record's position in the specified temporary storage queue. Each TS data record is stored in the same temporary storage file on the first server computer regardless of which server computer executes the WriteQ TS instruction. Each user application process also responds to execution of a ReadQ TS instruction specifying a temporary storage queue from which data is to be retrieved, by reading at least one TS data record from the temporary storage file.

ABSTRACT EP 747812 A2

The present invention is a distributed computer system having a plurality of end user terminals and a plurality of loosely coupled server computers that share no resources with each other. A multiplicity of user application processes are distributed over the server computers. A transaction start table, stored on a first one of the server computers, stores transaction start data representing transactions whose execution has been requested by other transactions being executed by the user application processes. The transaction start data indicates a start condition for each transaction whose execution has been requested. For most requested transactions the start condition is a time value indicating an earliest time at which the requested transaction's

execution should be started. When any of the user application processes executes a Start transaction function, a transaction start record is generated and stored in the transaction start table. The transaction start record is stored in the same transaction start table on the first server computer regardless of which server computer executes the Start transaction function. A transaction start process evaluates the start condition for each transaction whose execution has been requested. When the start condition for a requested transaction is satisfied, the transaction start process initiates execution of that requested transaction.

English Abstract

Method and apparatus for managing financial transactions for multiple
counter parties that allows traders, market makers, dealers, and prime
brokers to negotiate with multiple liquidity providers simultaneously,
and to receive and respond to transaction processing directives and
settlement instructions in real time (100). The invention, which may be
accessed over an interconnected data communications network (160), such
as the Internet, using a standard Web browser, as well as via a
proprietary user interface, automatically provides customers, traders,
executing banks, funding banks, prime brokers and liquidity providers
with up-to-date settlement and allocation details for previously-executed
financial transactions as they are received (110).

French Abstract

L'invention concerne un procede et un appareil de gestion de transactions
financieres impliquant plusieurs contreparties, permettant a des
negociants, a des decideurs de marche, a des agents de contrepartie, et a
des courtiers de negocier simultanement avec plusieurs fournisseurs de
liquidites, et de recevoir et de repondre a des directives de traitement

et a des instructions d'etablissement de transaction en temps reel.
L'invention, a laquelle on peut acceder par un reseau de communications de donnees interconnecte, tel que l'Internet, au moyen d'un navigateur Web standard, ainsi que via une interface utilisateur proprietaire, met automatiquement, des reception, a disposition des clients, des agents de contrepartie, des banques executantes, des banques de financement, des courtiers et des fournisseurs de liquidite les details d'attribution et de reglement a jour de transactions financieres prealablement realisees.

English Abstract

In the real estate business, in order to keep track of the activities
involved in selling, buying, or leasing a property, a real estate
information managing and transferring system and method have been
developed. In an embodiment of a real estate transaction system (110) of
the invention, several modules have been communicatively coupled to
provide a complete and reliable system of tracking buyers' and sellers'
activities and keeping a Realtor (120) informed and prepared at all
times. The real estate managing and transferring system can be made
accessible by users, such as Realtors (120), and can include a host
server (150) with communicatively adapted parts to manage and transfer
real estate information.

The present invention relates to an information processing system of transaction between companies which in a mode of realization preferred intends to provide services of hiring of vehicles for users has request level comprising a gate of Internet network thanks to which the user has request level can access has a plurality of suppliers of services comprising a data-processing network of company integrated for at least a supplier of services of hiring of vehicles. The data-processing network of supplier of services of hiring of vehicles also configures for the interconnection of a geographic plurality of branches of diverse, presenting the catalogue of their vehicles of hiring available and the programs with regard to them like for the management of all the data of transaction relating to its company. The gate of Internet network allows a connectivity and a transferability universal for an association of companies has several levels which regularly place requests levels of purchase of hiring with its associates commercial and also the other suppliers of services which can or not have the same system and data-processing software of company integrated. The use of the procedure and the apparatus of the present invention makes it possible to place, of great volumes of transactions of hiring, to control them, to modify them in the course of operation, and to conclude them with operations from financial accountancy and payment practically without human intervention.

English Abstract

A system for processing merchandise sale transactions for customers in a point of sale and warehouse facility. A main processor has a database for storing customer identification information and merchandise information and processes sale transaction records for customers. A point of sale system coupled to the processor has a controller and at least one pen-based computer in communication with the controller via RF transmissions. Program instructions respond to entry on the computer of a customer number and to entry of merchandise identification numbers to build a sale transaction record of selected items for purchase. The program instructions display item information and enable selection of items for addition to the sale transaction record, display delivery method instructions and enable their selection for addition to the sale transaction record, and transmit the transaction record to the processor to effectuate warehouse delivery of the selected items according to the selected delivery instructions. The system integrates point of sale and warehouse processing functions to enable delivery of merchandise to customers in the shortest possible time.

ABSTRACT EP 1562351 A2

Membership information for participating computer systems participating in a multi-party conferencing session is distributed by intermittently exchanging link databases with one or more neighbor computer systems. A link database includes one or more link state records, each link state record identifying a participating computer systems and a list of neighbor computer systems that are logically linked to the participating computer system. When a new computer system joins or a participating computer system leaves the multi-party session this joining or leaving change is reflected in the link databases of corresponding neighbor computer systems. As the neighbor computer systems exchange link databases, the change is eventually propagated to all the participating computer systems. Accordingly, participant computer systems continually transition towards a steady state where each participant computer system is aware of other participant computer systems and logical links associated with other participant computer systems.

... whether the quote they made was selected.

In one embodiment of the present invention, the **system** receives a trade
record from a first settlement clerk associated with the quote requester.
This **record** includes settlement **instructions** **appended** to the trade
record by the first settlement clerk. Upon receiving the trade record,
the **system** looks up permission information for the first settlement
clerk in a database, and then augments...

Detailed Description

... may be taken on a cancelled payment instruction.

2 0 Figure 12 shows the approval **process** for the payment instruction in the purchasing organisation in greater detail.

If the payment instruction requires explicit authorisation (1 2. 1) then the payment **instruction** data **record** is **added** to the appropriate authorisation workflow (12.2).

2 5 When an individual with the appropriate level of access to authorise the payment instruction logs into the integrated EP **system** (12.3), he can browse a list of payment instruction awaiting approval (12.4). This ...

...actions update the payment instruction data record in the integrated EP system. In addition, the **systems** that 3 0 comprise the integrated EP **system** use the business rules for the organisation to determine whether further authorisation (1 2. 1) is required and if so the payment **instruction** data **record** is **added** with the appropriate authorisation workflow (12.2).

When an invoice or payment is authorised or declined, the integrated EP **system** may create a notification (12.7) for the attention of the Accounts Payable department.

This...

English Abstract

Embodiments of the invention provide money transfer convenience cards and methods and systems for using them. Such embodiments can be used in a relationship between a customer, and transaction provider and a service provider. The transaction provider can provide money transfer services for the customer, and the customer can have an account associated with a convenience card. Embodiments of the invention can be used with a variety of service providers. Merely by way of example, in accordance with some embodiments, the service provider can be a merchant or the product can be a tangible good. In accordance with other embodiments, the service provider may be a plurality of service providers, each providing similar and/or different services. In accordance with other embodiments, the service provider can be a telecommunication service provider and/or the product can be a telecommunication service. Thus, in some cases, the award credited to the customer's account by the transaction provider control can comprise sufficient credit to allow the customer to place a telephone call of a certain duration from the transaction's origination location to its destination location.

French Abstract

Des modes de realisation de la presente invention concernant des cartes pratiques de transfert d'argent, ainsi que des procedes et des systemes

pour les utiliser. Ces modes de realisation peuvent etre mis en oeuvre entre un client, un prestataire de transaction et un fournisseur de services. Le prestataire de transaction peut fournir des services de transfert d'argent au client, et le client peut disposer d'un compte associe a la carte pratique. Ces modes de realisation peuvent etre mis en oeuvre aupres de divers fournisseurs de services. Le fournisseur de services peut etre, par exemple, un commercant ou le produit peut etre un bien tangible. Dans d'autres modes de realisation, le fournisseur de services peut etre une pluralite de fournisseurs de services, chacun fournissant des services identiques et/ou differents. Dans d'autre modes de realisation encore, le fournisseur de services peut etre un fournisseur de services de telecommunications et/ou le produit peut etre un service de telecommunications. Dans certains cas, la prime creditée sur le compte du client par le dispositif de commande du prestataire de transaction peut comprendre un credit suffisant pour permettre au client d'effectuer un appel telephonique d'une certaine duree du lieu d'origine de la transaction a son lieu de destination.

Fulltext Word Count: 9546

English Abstract

The invention provides a secure online payment method and system. In an
embodiment of the invention, a transaction system (100) facilitates
online purchase of merchant items by customers and to have those
purchased items billed, i.e., debited, to a telephone account.
Particularly, the system comprises a number of customer web access
devices, a TCP/IP communications network, a number of merchant computers
(130), a centralized payment server (140), and a number of
telecommunication company (TELCO) (150) networks. Communications are
bridged between the TCP/IP network and the number of TELCO (150) networks
implementing, for example a common channel signaling (CCS) based
protocol, such as signaling system 7 (SS7).

French Abstract

L'invention concerne un procede et un systeme de paiement en ligne
securise. Dans un mode de realisation de l'invention, un systeme de
transaction facilite l'achat en ligne d'objets de commercants par des
clients et la facturation de ces objets achetes, par exemple, par debit,

sur un compte du telephone. Plus precisement, le systeme comprend un certain nombre de dispositifs d'accès au web de clients, un reseau de communications TCP/IP, un certain nombre d'ordinateurs de commercants, un serveur de paiement centralise et un certain nombre de reseaux de societes de telecommunication (TELCO). Les communications sont pontees entre le reseau TCP/IP et les reseaux TELCO mettant en oeuvre, par exemple, un protocole fonde sur la signalisation par canal semaphore (CCS), tel qu'un systeme de signalisation 7 (SS7).

English Abstract

An integrated merchant to customer value added processing system for
providing integrated financial EFTPOS transactions and effective
integrated, parallel processing of a customer relationship management
tool (CRMT) value added transaction data processing system (12).
Transaction data is inputted. A first session is opened and a first set
of data is transferred to a host and the session is closed and a value
added application is initiated. Outputs are stored and a second session
is opened. A financial EFTPOS transmission is initiated and the session
remains open until an output response is received. An EFTPOS receipt is
generated and a third session is opened and the output from the second
session is transmitted and a selection is made from value added options.
The host customer account and merchant account is updated and a value

added option output is generated.

French Abstract

L'invention porte sur un systeme integre de traitement de la valeur ajoute relative a des echanges entre vendeur et client, effectuant des transactions financieres integrees EFTPOS et une gestion integree efficace en parallele du systeme (12) de traitement CRMT (outil de gestion des relations client) des donnees d'etablissement de la valeur ajoutee). A cet effet: on introduit les donnees de la transaction, puis on ouvre une premiere session, puis on transfere un premier groupe de donnees sur un hote, puis on ferme la session, puis on lance l'application <=valeur ajoutee>=, puis on stocke les resultats, puis on ouvre une deuxieme session, puis on lance la transaction financiere EFTPOS, et la session reste ouverte jusqu'a la reception en reponse d'un resultat. Un reçu etant produit, on ouvre une troisieme session, tandis que le resultat de la deuxieme session est transmis, puis on opere une selection parmi les options de valeur ajoutee. Le compte du client hote et le compte du vendeur sont alors mis a jour et le montant de la valeur ajoutee est calcule.

Fulltext Word Count: 8179

English Abstract

A customer making a credit card transaction inserts their smart card into a card reader attached to the merchant's system. The card reader activates the customer's card and passes certain merchant information. The merchant's system then requests a "billing digest" from the customer's card. The billing digest is returned to the merchant's card reader that forwards it (and the transaction information which includes customer information and merchant information) to the corresponding credit card issuer, which maintains the customer's credit card account. In one embodiment, the customer information and the merchant information are encrypted. Upon receiving the billing digest, transaction information is decrypted if necessary and the credit card issuer looks up the customer's master key using the customer's account number. The credit card issuer then uses the transaction information to re-compute the billing digest (an authentication billing digest) and compares this new value with the billing digest submitted by the merchant. If authentic, the billing digest and authentication billing digest values are equivalent, then funds are transferred and an acceptance notification is returned to the merchant. If not authentic, a denial notification is returned to the merchant. Security is further enhanced by utilizing a unique reference for each transaction in the unique customer information used for creating the billing digest.

French Abstract

Un client qui effectue une transaction par carte de credit introduit sa carte a puce dans un lecteur de carte fixe a un systeme de commerce. Ce lecteur de carte active la carte du client et passe certaines informations commerciales. Le systeme de commerce demande ensuite un <=resume de facturation>= issu de cette carte de client. Ce resume de facturation est retourné au lecteur de carte du commercant, lequel le fait suivre (ainsi que les informations de transaction qui comprennent les informations relatives au client et au commercant) a l'emetteur de cette carte de credit qui tient le compte de cette carte de credit de client. Dans un mode de realisation de l'invention, les informations relatives au client et les informations relatives au commercant sont cryptees. A reception du resume de facturation, les informations de transaction sont decryptees, le cas echeant, et l'emetteur de la carte de credit recherche la cle principale du client en utilisant le numero de compte de ce client. L'emetteur de la carte de credit utilise ensuite les informations de transaction pour recalculer le resume de facturation (un resume de facturation authentifie) et il compare cette nouvelle valeur avec le resume de facturation soumis par le commercant. S'il est authentique, le resume de facturation et l'authentification des valeurs de resume de facturation sont equivalents, les fonds sont transférés et une notification d'acceptation est retournée au commercant. S'il n'est pas authentique, une notification de refus est retournée au commercant. On renforce la securite en utilisant une reference unique pour chaque transaction dans les informations de client uniques utilisees pour creer ce resume de facturation.

English Abstract

An electronic shopping mall includes a display (214) for showing a customer products offered by an on-line merchant (312). The customer makes a product selection (322) and is asked to guarantee payment for the order, including any associated tax and shipping charges. The electronic shopping mall also includes a cash acceptor (208). The customer may select a cash payment option (326) and deposit paper currency in the cash acceptor (208). The electronic shopping mall includes an automatic recognition circuit that authenticates and values such paper currency. When the customer deposits sufficient cash to pay for the order, the on-line merchant receives the order and proceeds to arrange shipping. The customer may also provide shipping information at the electronic shopping mall by way of keyboard entry (216) or by presenting an electronic access card. The electronic access card includes a unique customer identifier. The unique customer identifier is used to access a database (112) having the customer's shipping address. The database (112) also includes a record indicating any previous balance the customer may have accumulated.

French Abstract

La presente invention concerne un centre commercial electronique comprenant un ecran qui permet aux clients de voir les produits proposes par un vendeur en ligne. Une fois la selection de produits effectuee, le client est invite a garantir le paiement de sa commande, y compris des eventuelles taxes associees et des frais d'expedition. Par ailleurs, ce centre commercial electronique comprend un collecteur d'especes. Le client peut selectionner une option de paiement en especes et deposter ensuite un billet de banque dans le collecteur d'especes. Ce centre commercial electronique comprend egalement un circuit de reconnaissance automatique qui authentifie et evalue les billets de banque. Lorsque le client depose suffisamment de liquide pour payer sa commande, le vendeur en ligne recoit alors l'ordre et procede a l'expedition de la commande. Le client peut egalement fournir des informations d'expedition au centre commercial electronique via des saisies sur clavier ou en presentant une carte d'accès electronique. Cette carte d'accès electronique contient un identificateur de client unique, lequel est utilise pour acceder a une base de donnees contenant l'adresse d'expedition du client. Cette base de donnees comprend egalement un relevé indiquant l'ancien solde du client.

Detailed Description
 ... a unique identifier.

The unique identifier, the unique confirmation code, the amount deposited, the associated **merchant** code, transaction code and customer information are all transmitted as a record to both the **merchant server** and the transaction **server**. In response, the transaction **server** adds a **transaction record** that credits the respective customer account.

At step 1732, that record is also saved locally...to an order associated with the customer. When a customer completes an order, the associated **merchant server**, for example, **merchant server 2006** transmits an **order record** to **account server 2018**.
 ..Account **server 2018** adds this **order record** to a database entry associated with the customer.

This database entry resides in the customer...

English Abstract

The present invention provides apparatus, systems and methods to wirelessly pay for purchases, electronically interface with financial accounting systems, and electronically record and wirelessly communicate authorization transactions using Personal Digital Assistant ("PDA") (also referred to as Personal Intelligent Communicators (PICs), and Personal Communicators), palm computers, intelligent handheld cellular and other wireless telephones, and other personal handheld electronic devices configured with infrared or other short range data communications (for referential simplicity, such devices are referred to herein as "PDA's"). The present invention further provides apparatus, firmware, software programs and computer-implemented methods for making service and/or sale service charge payments for credit card charges, debit card charges, electronic cash transfers, ticket and other like financial transactions and for other types of transactions, such as for electronic coupons, where the amount of the transaction is for a small amount of money, such as, for example, less than \$5.00.

French Abstract

L'invention concerne un appareil, des systemes et des procedes permettant de payer sans fil des achats, de cooperer electroniquement avec des

systemes de comptabilite financiere, d'enregistrer electroniquement et de communiquer sans fil des transactions d'autorisation au moyen d'un assistant numerique personnel (PDA) (egalement appele communicateurs intelligents personnels -PIC- et communicateurs personnels), d'ordinateurs de poche, de telephones portatifs cellulaires intelligents et d'autres telephones sans fil, ainsi que d'autres dispositifs electroniques portatifs personnels permettant des communications de donnees a infrarouge ou d'autres communications a courte portee (pour simplifier, les dispositifs precites seront desormais appeles PDA). L'invention concerne egalement un appareil, des micrologiciels, des logiciels et des procedes informatises permettant d'effectuer des paiements de services et/ou de frais de services de vente correspondant a des frais de carte de credit, de carte de debit, des transferts electroniques de fonds, des transactions de tickets et autres transactions financieres, et a d'autres types de transaction, tels que des coupons electroniques, le montant de la transaction correspondant a une petite somme d'argent, moins de 5 USD par exemple.

French Abstract

L'invention concerne un systeme, un procede et un article manufacture
s'utilisant pour un processus de demande de credit. Dans un premier
temps, une demande de credit emanant d'un acheteur utilisant un reseau
est recue. En reponse a cette demande de credit, la demande de credit est
envoyee a une banque par l'intermediaire du reseau, ce, afin d'evaluer le
credit dont dispose l'acheteur, sur la base de la demande de credit. Si
le credit est approuve, l'acheteur est accredite par attribution d'un
identificateur. Un mot de passe est ensuite produit pour l'acheteur.
L'identificateur et le mot de passe sont memorises dans la base de
donnees. Le mot de passe est ensuite envoye a l'acheteur a l'aide du
reseau. En application, l'acheteur doit utiliser le mot de passe pour
lancer des transactions sur le reseau. De plus, l'acheteur se voit
attribuer une carte portant l'identificateur..

English Abstract

The system of the present invention which creates a payment system for online commerce is implemented through client software on the computers of the system participants and a central transaction administration system. Each client software component interacts with the client software of other system participants and with the central transaction administration system. The transaction administration system receives transaction requests from each party to a transaction and compares the information received from each party to ensure that the transaction information received from each party matches, thereby authenticating the transaction.

French Abstract

L'invention concerne un systeme de paiement de commerce en ligne mis en application au moyen d'un logiciel client installe sur les ordinateurs des abonnes du systeme et d'un systeme central de gestion des transactions. Chaque logiciel client interagit avec le logiciel client d'autres abonnes du systeme et avec le systeme central de gestion des transactions. Le systeme de gestion des transactions recoit des demandes de transaction de chaque abonne concernant une transaction et compare les informations recues de chaque abonne afin de s'assurer que les informations recues de chaque abonne concernant la transaction correspondent bien, authentifiant ainsi la transaction.

English Abstract

An internet-based commerce system (100) simultaneously usable by multiple purchasing organizations (112) and multiple vendors (114) while controlled by a virtual single server and database is disclosed. The commerce system handles the requisitions for goods and services by system users within an purchasing organization and directs requisitions to other users for approval within that purchasing organization using approval routes electronically established within the database. Requisitions are electronically processed into Requests for Quotation (RFQ), Requests for Information (RFI) or Requests for Bid (RFB) that are then released to the internet for electronic responses by users representing vendors who access the system. Vendors with profiles matching the requests are notified preferably through response-prompting e-mail. Using the system, buyer users for purchasing organizations process electronic responses into awards. The system then notifies the awardees and other vendors.

French Abstract

L'invention concerne un systeme de commerce via Internet (100) pouvant etre simultanement utilise par de multiples organisations d'achat (112) et de multiples vendeurs (114) et commande par un seul serveur virtuel et une base de donnees associee. Ce systeme de commerce gere les commandes de biens et services effectuees par les utilisateurs du systeme au sein d'une organisation d'achat et adresse ces commandes a d'autres utilisateurs au sein de cette organisation d'achat en vue d'une approbation via des methodes d'approbation electroniques etablies dans la base de donnees. Ces commandes sont traitees par voie electronique et transformees en demandes de prix (DP), en demandes d'informations (DI) ou

en demandes d'offres (DO) qui sont ensuite accessibles sur Internet afin que les utilisateurs représentant les vendeurs répondent par message électronique. Les vendeurs, dont les profils correspondent aux demandes, sont avertis de préférence par courrier électronique les invitant à répondre au courrier. Grâce à ce système, les utilisateurs acheteurs traitent les réponses électroniques et en acceptent certaines. Le système notifie alors les vendeurs sélectionnés et les autres vendeurs.

Examination 20010222 Request for preliminary examination prior to end of 19th month from priority date

Detailed Description

DESCRIPTION

Internet-Based Commerce System

This PCT application claims priority to U.S. Provisional Application Serial No.

60/132,337 filed May 3, 1999 having the title "Internet-Based Commerce System," and U.S. Application Serial No. 09/477,054 filed January 3, 2000 having the title "InternetBased Commerce System," both of which are fully incorporated herein by reference.

Background Of The Invention

The present invention relates to the field of electronic commerce. In particular, the present invention relates to a computer and Internet-based commerce system for handling the request, bidding, and procurement activities between agencies, organizations and businesses and an array of vendors for commodities, including goods and services.

In recent years, many Internet-based systems for processing requests for quotations for goods and/or services and then handling responses from compatible sellers have been disclosed and developed. For example, U.S. Patent No. 5,758,328 issued to Giovannoli and incorporated herein by reference, discloses a computer-based communications network in which buyers and suppliers that are registered in the system communicate requests for goods and/or services and responses to requests. Moreover, systems for routing and processing procurement information to different personnel within an organization are also known. U.S. Patent No. 5,361,199 issued to Shoquist et al., also incorporated herein by reference, describes system programming that receives data from a buyer and routes the document data to other personnel involved in a procurement processing scheme. However, even with the wide proliferation in recent years of computer and Internet-based commerce, a system that can fully service the procurement administration requirements of many organizations and vendors all at once has yet to be developed. Further, the prior art computer and Internet-based commerce systems that apply a commodity code catalog to standardize communication between system users cannot tailor the commodity catalog to the needs of individual users. A need therefore exists for procurement system that enables any individual within a large or small organization to purchase any goods and/or services available from vendors who access the system. A need further exists for a system that enables multiple agencies, businesses and organizations to electronically process their requests for goods and services, communicate these requests to interested vendors, accept electronic responses and bids from prospective vendors, and issue awards to vendors in a fully integrated and data-linked manner. A need also exists for a system that uses a commodity code or catalog to aid in the communication between and filtering of buying agencies and vendors, while enabling individual agencies to tailor the catalog to their own particular needs.

Summary of the Invention

The present invention is directed to an Internet-based commerce system

simultaneously usable by multiple purchasing organizations and multiple vendors while controlled by a virtual single server and database. The commerce system is comprised of a firewall subsystem, a web server, a mail server, a database server, and central database. The commerce system handles the requisitions for commodities, including goods and services by system users and directs agency requisitions to other users for approval whether internal or external to that agency using approval routes previously established electronically within the central database. Requisitions are electronically processed into Requests for Quotation, Requests for Proposal, Requests for Information or Requests for Bid that are then released to the Internet for electronic responses by users representing vendors who access the system. Vendors with profiles matching the requests are actively notified of the requests preferably through response-prompting electronic mail. Using the system, users profiled by the system as buyers for the purchasing organizations process the electronic responses into awards. The system then notifies the awardees and makes available information about the awards to other vendors.

The system enables each purchasing organization to have its own unique electronic catalog of commodities to simplify and standardize the procurement process within the organization, while the system uses a basic catalog, preferably the NIGP commodities code, as a backbone for screening and communicating with vendors. Further, because the system operates with one virtual server and database, compilation and sharing of data that are stored on the system are possible. Vendor performance, user workload data can be compiled and shared within an agency or agencies using data search, compilation and representation software tools that known in the art. Similarly, users are preferably restricted, in accordance with user identifications used to access the commerce system, to a subset of data records in the database. The above and other objects, features and advantages will become apparent to those skilled in the art from the following description of the preferred embodiments.

Brief Description of The Drawings

FIG. 1 depicts a preferred embodiment of the basic hardware configuration for the Internet-based commerce system.

FIG. 2 depicts a preferred embodiment of the software module configuration for the Internet-based commerce system.

FIG. 3 depicts the basic routing within a procuring organization of an electronic requisition from the initial request to the release of the corresponding RFX (a pre-award document type) to the Internet.

FIG. 4 is a flowchart depicting a preferred software process for generating and communicating a Request Document record to a buyer.

FIG. 5 is a flowchart depicting a preferred software process for generating and releasing an RFX from a Request Document record.

FIG. 6 is a flowchart depicting two preferred software process methods of notifying vendors of released RFXs.

FIG. 7 is a flowchart depicting a preferred software process for enabling vendor responses to released RFXs and generating awards corresponding to the RFXs.

Detailed Description Of The Preferred Embodiments

FIG. 1 depicts a preferred embodiment of the basic hardware configuration for the Internet-based commerce system 100. The commerce system 100 preferably comprises several subsystems including a firewall 102, a web server 104, mail server 106, database server 108, and central database 110. Preferably, each subsystem is a computer such as a Silicon Graphics' Origin' 200, Intel' processor or other high-speed processing platform preferably having at least 500 megabytes of RAM and at least 25 Gigabytes

of hard disk memory. Preferably, however, each subsystem is configured to allow for the connection of additional computer hardware to distribute the processing, memory, and bandwidth load as needed. Functionally, the firewall 102 preferably polices the Internet communication with the commerce system 100. The system is preferably protected by a HTTPS 128-bit secure socket layer that essentially encrypts data that is transmitted over the Internet. Moreover, only users requesting system services over specified ports are handled by the commerce system 100. For example, HTML pages from users 112, 114 are served over a specific port address. Unless the port address for HTML pages is specified in the user's HTML communication, the user data is dumped by the firewall 102 preventing access to the rest of the commerce system 100. Similarly, File Transfer Protocol (FTP) communication is handled through another port. Again, the port must be specified in the FTP communication to enable access to the commerce system 100. Users from multiple agencies 112 and vendors 114 are handled by the commerce system 100 and share the central database 110. Specifically, the commerce system 100 will recognize a particular user, for example User 1, from a particular agency, for example Agency 1, or a particular vendor, for example Vendor 1. The number of users per agency, the number of users per vendor, the number of agencies and the number of vendors are all only limited by the system memory resources and the I/O bandwidth.

1.5 Communication internal to the commerce system 100 is preferably via Ethernet connection although another system communication protocol can be used. First, the firewall 102 is Ethernet-connected to the web server 104, which generally processes HTML pages into SQL instructions for the database server 108. The mail server 106 handles all e-mail communication and communicates with the database server 108 and web server 104 via an Ethernet connection. By having a mail server to handle much of the communication and data entry between users, I/O and computer processing bandwidth load is significantly reduced. Finally, the database server 108 handles all access to the central database 110, including processing the SQL statements from the web server 104 and instructions from the mail server 106. Optionally, the commerce system 100 additionally includes an Intranet server subsystem that features functions such as e-mail between users, calendars, chat rooms, message boards, task files, address books, and Intranet page publishing.

FIG. 2 depicts the preferred software modules and their configuration within the Internet commerce system 100. Preferably, each module performs a separate function that writes to or reads from the central database 110 as needed. The software system implementation includes an agency registration module 200, a vendor registration module 202, a login module 204, an agency system administrator module 206, an agency requisitioner module 208, an agency buyer module 210, an agency approver module 212, a vendor access module 214 and a batch module 216. First, the agency registration module 200 allows agencies to initially profile themselves to the commerce system 100, including identifying the system administrator for that agency. The agency registration module 200 further enables entry of general agency information including addresses and points of contact for the agency, billing, and revenue sharing. The vendor registration module 202 similarly allows vendor businesses to register themselves with the system and profile over the Internet the goods and services they supply. Optionally, the vendors can register to be on 24-hour call with respect to particular types of business opportunities. Further, the vendor registration module 202 preferably enables vendors to select specific agencies with which the vendors have a particular interest in doing business.

Also, when a previously registered vendor responds to a solicitation for a commodity that is not included in the profile record of commodities that the vendor supplies, then vendor registration module 202 preferably automatically adds the commodity to the vendor's profile. Alternatively, if the vendor is registered for a solicited commodity, but is not listed

as a supplier with the soliciting agency, then the then vendor registration module 202 preferably automatically adds the specific agency to the vendor's profile record for that commodity. Preferably, the vendor is automatically via e-mail notified of the update to the vendor's profile record.

The login module 204 controls user access to system applications according to user ID. The login module 204 determines the identity of a user as the user logs into the commerce system 100 and then enables the particular applications, such as for example, the agency system administrator 206 module, agency requisitioner module 208, or agency buyer module 212, that the user is authorized to access. Finally, the login function 204 accesses the database I 10 to identify the active records that indicate the user's ID in one or more of its fields and then provides a summary of that data to the user in an information window. In this way, the user views its current workload related to the processing of requests of goods or services.

The agency system administrator module 206 is an application module that enables a particular agency user, called an agency system administrator, to establish and control all parameters associated with a given agency. Specifically, the agency system administrator module 206 enables the agency system administrator to enter or modify agency information, establish accounting structures, and populate and manage detailed commodity groups particular to the agency using the NIGP code or another commodity catalog as a platform. The system administrator can also enter data regarding agency delivery points, local area business preferences, miscellaneous agency-wide default values and any general requirements or instructions for documents originating from the agency.

The agency system administrator module 206 further allows the agency system administrator to establish users within the agency and associate users with particular applications, functions, and abilities. Specifically, the system administrator can create agency departments including department administrators and users. The system administrator further establishes approval workflow maps for individual users. An approval workflow map for a user designates other users to whom work completed by the user is made available.

Preferably, the agency system administrator module 206 also allows the agency system administrator to execute report inquiries to the database I 10. Various types of 15 reports are thereby generated. The reports that may be generated preferably include requisition-to-purchasing cycle time reports, purchasing cycle time reports, history of award reports, and vendor listing reports that are variable according to variations in listing criteria.

The agency requisitioner, agency approver, agency buyer, and vendor access modules 208, 210, 212, 214 are applications made available to users by the commerce system 100 depending on the individual configurations established by the system administrator. The agency requisitioner module 208 enables the user to produce and transmit a request for the purchase of particular goods and services. The agency approver module 210 is a mechanism for approving electronic agency documents. The agency approver module 210 preferably provides for the option of having at least five levels of approvals before an electronic requisition is forwarded to a buyer. The agency buyer module 212 is an application generally made available only to buyers. The agency buyer module 212 enables users configured with buyer capabilities to convert electronic requisition documents into pre-award document types, called RFXs, for the goods the buyer is assigned to buy. These RFXs include Requests for Proposal (RFPs), Requests for Bid (RFBs), Requests for Information (RFIs) and Requests for Quotation-(RFQs). The agency buyer module 212 further enables buyers to release RFXs to the Internet. Also, the vendor access module 214 enables users representing vendors to access

the commerce system 100 and view awards that have been made, business opportunities in the form of RFXs that have been released, and subsets thereof based on search criteria selected by the vendor. While vendors generally only use the vendor access module 214, vendors may optionally use the modules used by procurement organizations and thereby conduct business on the commerce system as both a buyer and a vendor. By enabling the combination of tools by a single business entity, the commerce system 100 enables vendor-to-vendor transactions. Preferably, the combination of tools is also used by nonprofit organizations (NPOs) to further enable NPO-to-business and NPO-to-agency transactions. Finally, preferably, vendors can request additions to the basic five-digit commodity code index used by the commerce system 100.

With respect to vendors in the construction business, the vendor access module 214 enables vendors who are general contractors to download construction plans developed for a public agency, such as those stored in a city plan holder's room. Additionally, registered 15 vendors who are construction subcontractors receive an e-mail notification from the commerce system's mail server 106 for each general contractor that downloads an agency's construction plans. The commerce system 100 thereby facilitates construction business communication between agency and general contractor and between general contractor and subcontractor.

The batch module 216 preferably executes at a particular time each night, processing the active records for all agencies that are registered on the commerce system 100. A change in a record's status based on the previous day's work typically will cause the batch module 216 to act on the record in some manner. For instance, the batch module 216 will change the status of RFX records that were previously released to the Internet but that are scheduled to be closed to bidding by the current date. Further, the batch module 216 initiates the e-mail to appropriate vendors of RFXs that are presently to be released to the Internet. A vendor who receives an e-mail of an RFX is filtered by the batch module 216 according to its registration status and the selected commodity codes and agencies in the vendor's profile.

FIG. 3 depicts an overview of one possible route for a request from the original requisitioner through the chain of users within an agency that must approve the request before its release to the Internet. The process begins with the creation of a Request Document record by a user within the agency or requisitioner 300, and then its transfer to a proper approver if an approval of the requisition is required as shown by the Require Approval branching step 302. The system's software processing of these first steps are detailed in FIG. 4. As shown in FIG. 4, a requisitioner first enters request document data on an HTML header page that has been provided to the user/requisitioner 400. The software enabling the entry of request document data is part of the agency requisitioner module 208. The request document header data for entry preferably includes a reference number for the request document and a confirming number to enable a rush of the request through the approval process including preferably, a direct e-mail to 10 appropriate approvers in the approval route and the provision for an emergency purchase order number. The header data may also include delivery date(s), delivery point(s), alternate delivery point(s), contact persons, and specific header notes. Preferably, if the requisitioner 300 specifies a non-standard delivery point, the system automatically detects the condition. Because the existence of a standard delivery point is preferably previously 15 specified in the setup for the procuring organization by the system administrator, a requisitioner's data entry of a non-standard delivery point results in an automatic notification e-mail to the procuring organization's system administrator. Finally, when the request document header page is completed, the header data is saved in a file in the central database 402.

In a preferred embodiment, the commerce system 100 provides each agency

the option using system-assigned reference numbers for documents or retaining an agency's indigenous numbering system. The commerce system 100 allows an agency to retain its own document numbering system by performing translations to and from the system's internal indexing scheme. For example, where an agency's designation for the first RFQ of the year 1999 may be "RFQ990001" the system will in real-time translate such entered document designations into its own index, such as "Q1999000001." The system also necessarily provides for reverse translation of document designations such as when a user seeks to have displayed a set of document numbers that are result of a specific search.

Preferably, the system 100 supports separate translation routines for each agency that chooses to retain its own document numbering scheme.

The requisitioner 300 is then prompted to complete a second HTML page of lineitem data for the request 404 relating to the goods to be included in the request document record. In this step 404, the commerce system 100 allows for date entry of the specific goods to be requested. To select the goods, the requisitioner 300 accesses an electronic catalog of goods organized according to a three-digit class, two-digit item, two-digit group and a three-digit detail. The class and item values preferably correspond to the standard NIGP code of goods and services. The group and detail digits correspond to specific details regarding the goods that are commonly requested by that particular agency. Thus, each agency on the commerce system 100 internally possesses its own tailored catalog of specific goods and services that it commonly requisitions. However, because each tailored commodities catalog exists on a single database I IO, the commerce system I 00 preferably allows agencies to merge their tailored NIGP codes, enabling a greater level of standardization while maintaining the details in the communication between procuring agencies and vendors.

In practice, the generation and use of a tailored commodities catalog preferably involves all users within a procurement organization. For example, for a request of a box of yellow 8 V2" by IP bond paper for a requisitioner's department, the requisitioner 300 will first scan the basic five-digit NIGP code for paper. However, within this basic code, the commerce system 100 will have specified various kinds of paper (i.e. yellow 8 1/2" by 11" bond) that that the agency has requested in the past. For goods that are first requested, the agency, through the functionality of the agency system administrator module 206, will have specified group and detail indices concatenated to the basic NIGP code that correspond to this specific kind of paper. Over time, group and detail indices for various kinds of paper that have been requested will be specified, resulting in a highly tailored NIGP-based catalog that is unique for each agency on the commerce system 100. Thus, as the requisitioner 300 is specifying the goods to be requested, the requisitioner 300 first scans his agency's tailored commodities catalog to determine if the specific goods in question are already in the catalog. If so, the requisitioner 300 can select those goods for requisition and then proceed to enter other data. If the desired goods are not in the catalog, the requisitioner 300 preferably has the option of requesting an addition to the catalog.

Alternatively, the requisitioner can directly make additions to the agency's commodity catalog 406.

On the second HTML page of the request, the requisitioner 300 enters other line item data including the quantity of the goods. Optionally, the requisitioner 300 enters the units of measure for the goods, whether it is a fixed asset, any purpose restrictions, a file attachment, line item notes, and any allowable variance in quantity. Preferably, the request allows for the entry of a specific fund from which the payment for the cost of the commodity is drawn. The request alternatively preferably allows for the entry of multiple funds to enable cost sharing between

funds for particular commodities. Allocation between funds is preferably enabled according to percentage of cost, by dollar amount or by quantity. Funds are preferably specified by entry of ftind-specifying information in data fields indicating the organization, the account, the task, the subtask, the option and/or the activity.

After the requisitioner 300 completes data entry or at any other time during the generation of the request, the requisitioner 300 preferably may edit or review the header page, the commodity description, or any other field. Once the data on the request pages has been entered, the requisitioner 300 preferably saves the line item data in the central database 110, 408. The combined header and line item data form a single request document record in the central database 110.

In the next step, the commerce system 100 scans the approval routing map that is unique to the requisitioner 300 that originates the request document record 410. The approval map, called an Agency User Workflow record, is previously generated by the system administrator and stored in the central database 110. The approval map defines the route of users that the request document record must take before a buyer for the procuring organization reviews the request document. The particular approval route for a request document record is preferably defined by the requisitioner's position within the organization, the commodity or commodities requested, the amount requested and the price. Any one or all of these variables can affect the approval route.

Preferably, the particular approval route is also defined by any alternate users that have been specified to act in place of one or more available approvers. More generally, the commerce system 100 allows alternate users to be specified when the usual user for a particular task is absent, unavailable, on vacation, etc. In such circumstances, the system enables establishing pseudo accounts to give an alternate user the rights it requires to perform as an alternate user. Moreover, if the usual user possesses multiple capabilities, for example, rights to initiate requisitions, act as a buyer, and act as a requisition approver, then the system 100 enables different alternate users to be specified for each of the rights.

Further, when the usual user returns or is again available, the system 100 preferably resets the rights, status and capabilities to the usual user.

From the Agency User Workflow profile defined in the commerce system 100 for the requisitioner 300 and the parameters values specified in the particular request document record, the commerce system 100 generates an Agency Solicitation Route record 412 that becomes part of the request document record. Thus, inherent in the requisition process of the commerce system 100 is effectively an electronic audit trail.

Preferably, every significant act by a user in the process of completing, approving, responding to or awarding a requisition is stored in the commerce system 100. Thus, the responsible parties involved in any procurement are readily determined. Next, if the requisitioner 300 desires to request additional goods as part of the same document request record, line item data for such additional goods may be entered 414 on subsequent line item HTML pages. When all goods have been entered into the document request record, the commerce system 100 saves the final document request record in the central database 110, 416. The record includes a Status field that holds a value corresponding to the status of the request. Once the data is saved, a Current Stop ID field in the Agency Solicitation Route designates the user in the agency that must approve the request. Normally, the approver is made aware of the request by actively performing a database scan of requests within the agency that require that approver's approval. The database server scans the Current Stop ID in all of the agency's requests and lists those requests for the

approver 418.

The approver can similarly be made aware that a new document request record has been created that requires his approval when the approver first logs into the commerce system 100 with his user ID. As mentioned above, the login module summarizes a user's workload as the user logs into the commerce system 100. The data in the information window provided to the user upon login preferably includes the following numerical summary regarding request documents involving the user.

- # of request documents in the approval-processing phase
- # of request documents requisitions
- # of request documents awaiting an action by a buyer
- # of request documents viewable on the Internet
- # of request documents awaiting an award from a buyer
- of request documents placed on hold by a buyer
- of request documents being worked on by a buyer
- of request documents in a buyer's approval flow
- of request documents in which an award was made but further approval is required before a purchase order is issued
- # of request documents that were disapproved by a buyer's approver
- # of request documents awarded

As the data in the information window changes, the user is informed of the progress of examine the particular records requiring his attention.

Referring again to FIG. 3, the transmission of a requisition to a proper approver 304 effectively takes place with the modification by the system of the Current Stop ID field in the request document record as each approval is made. Depending on the approval chain or Agency User Workflow for the request document record, the request document record for a request may have one or more changes to its Current Stop ID field as approvals to the request are authorized. When a proper approver reviews the data in the request document record, the approver must decide whether to approve or disapprove the request 306. As each approval is authorized, the Current Stop ID field is modified to have the user ID of the next approver. If all approvals in the request approval route are given, the system will modify the Current Stop ID field in the request document record to that of a buyer in the requisitioner's solicitation route and corresponding to the goods and/or services specified in the request.

If the request document is disapproved, the Current Stop ID field is modified to the user ID of the original requisitioner 300. Notes or comments from the approver who disapproved the request document may also be saved as part of the request document record for review by the original requisitioner 300. Thus, when the original requisitioner 300 instructs the system to scan for request document records (that is, the Current Stop ID fields of those records) with his user ID, the requisitioner 300 will see the disapproved request document records with the comments from the approver in his approval route that disapproved the request. In the approval route shown in FIG. 3, only one approval is required before the request is made available to the appropriate buyer 308 specified in the solicitation route for the request. If no approval is required for a request document record generated by a requisitioner 300, the request document record proceeds directly to the appropriate buyer 308.

Like any other user, the appropriate buyer 308 for the request document record is made aware of the request document record when the buyer 308 actively instructs the system to scan the database 110 for approved request document records having that buyer's user ID in the Current Stop ID field and/or through the workload summary process performed by the login module 204. The approval process from the time that the approved request document record reaches the buyer 308 until the request document record is released to the Internet is similar to the method of processing the original request I 0 document record into an approved request

document record that is viewed by a buyer.

FIG. 5 details the steps in converting an approved request document record into an RFQ, RFI, RFB, or RFP record that is released into the Internet. First, as noted above, the buyer 308 is notified of or may actively scan for approved request document records having his user ID. Preferably, multiple methods of workload distribution are provided by 1 5 the system to enable the designation of document records to various buyers. The system preferably may automatically select buyers based on the NIGP code of the commodities requisitioned. Further, the system may enable a pool of document records to be established from which buyers select items to process. As another alternative, the document records are initially assigned to a supervising buyer who then assigns items to other subordinate buyers. In each of these methods, the Current Stop ID is simply changes to reflect the current disposition of the document record.

Approved request document records are distinguished from request document records awaiting approval by a separate field in the request document record called a Status field. The commerce system I 00 scans for Status fields with a value corresponding to an approved request document record and having a Current Stop ID with a particular buyer's user ID. The system then provides the buyer 308 with the details of the approved request document record to the buyer 308 on the buyer's terminal. At this time, the header and line item data entered by the original requisitioner 300 are viewable by the buyer 308, 500. Furthermore, the buyer 308 can view, edit and/or add to the fields of the approved requisition record, such as confirming or changing the delivery point for one or more of the line items of goods included in the requisition 502.

When the buyer 308 has completed his modifications to the approved request document record, the buyer 308 then chooses whether to approve for RFX 310 the approved request document record and thereby create an RFX, or to disapprove the requisition 504, returning the requisition to the original requisitioner 300, 510. As shown in FIGS. 3 and 5, if the request document record is disapproved buy the buyer 308, the request document record is routed back to the original requisitioner 300, 5 1 0. The Current Stop ID field is changed to the user ID of the original requisitioner 300, and the Status field preferably becomes that of a request document disapproved by a buyer 308, 506.

Optionally, the buyer 308 may enter notes on the reasons for disapproval 508. The system I 0 saves these notes as a separate data file that is linked to the request document record by the document reference number for that record. While the original requisitioner 300 may actively scan the system for buyer-disapproved request document records, preferably the system automatically e-mails the requisitioner 300 of the disapproval.

If the buyer 3 08 approves the request document, the commerce system I 00 changes the Status field for the request document record into that of an RFX in progress 512. The system then sends an electronic page for the entry of RFX data to be stored in the same record 514. On this page, the buyer 308 can confirm or add a reference number for the RFX, select the response type (RFP, RFB, RFI, or RFQ) for all or selected line items, select the closing date for the receipt of vendor responses, and select or confirm the delivery date for each line item. Optionally, the buyer can edit or enter the freight pay type, confirm the delivery point, modify the source of funds for payment, add new instructions for the vendors regarding the request, or add record header notes. Additional instructions and header notes are preferably saved as a separate file, and are preferably linked to the new RFX document record by the document reference number, the requisition number, and detail and item numbers. The RFX page preferably is then saved as part of the original request document record that was created with the original requisitioner 300.

At this stage, the Status field is again modified depending on the action

selected by the buyer 516. Optionally, the RFX can be approved for RFX 310 by the buyer 308. In this case, the Status field is changed from an RFX in progress to a value representing a buyer-released RFX 518. As shown in FIG. 3, a release of the RFX by a buyer 308 may or may not indicate that the RFX is released to the Internet. If the buyer's decision requires the RFX approval 312 of an RFX approver 314, the status of the RFX may simply be changed to that of an RFX in Approval and correspondingly, the Current Stop ID will be changed to the appropriate RFX approver 314, 520 in that buyer's previously established approval map. If the buyer's decisions require no further approval, the Status field for the RFX is changed to that of an Internet-released RFX 316, 522. The RFX approver then preferably has the same choice of options 318 as the buyer 308, that is, releasing, holding or disapproving of the RFX. In each case, the Status field is changed accordingly. In FIG.

3, only one RFX approver 314 is necessary before the RFX is released to the Internet 316, 524. On the other hand, an RFX could require additional RFX approvers 314, if an agency's system administrator chooses to so configure the buyer's approval map in that manner. However, once the last RFX approver in the approval route for an RFX releases the RFX, the system changes the Status field for the RFX to that of a Released RFX. A Released RFX represents a Status field that vendors on the Internet can view.

The buyer 308, alternatively, also has the option of placing the RFX on hold 526, a situation that would be acted upon by the system by changing the Status field value for the RFX record. One advantage of enabling the buyer 308 to place an RFX record on hold is that it provides the foundation for enabling the buyer 308 to merge different RFX records that may include the same goods or category of goods. By placing an RFX on hold, a table is preferably generated of such held RFXs and is preferably organized according to the NIGP code(s) and/or the release date specified in the RFX. Preferably, if the buyer desires to merge an RFX with others making similar requests, the system generates a new RFX record that encompasses the items in the held RFX records that have been merged together. The new merged RFX, having fields that reference the RFXs that it comprises, is then later released by the buyer 308 to the Internet. By having this capability, discounts for larger volumes of goods may become available that might not otherwise be available if RFXs were individually released. Preferably, because multiple procuring agencies are using the same central database 110, RFXs from different procuring organizations can pool RFXs with similar requests and potentially obtain greater discounts than could be obtained otherwise if the agencies conducted their procurement of goods and services independently.

FIG. 6 depicts two alternative methods by which vendors using the commerce system are notified of RFXs that agencies have released. By a first method, a vendor first logs into the commerce system 600. As released RFXs that have not been closed to bidding have a particular Status field value, such RFXs are viewable by vendors who wish to examine the database. Optionally, vendors can perform specific searches within the set of RFXs by filtering the set according to particular agencies, commodities, etc. 602. By applying various kinds of filtering to the set of viewable RFXs, vendors can view a subset of RFXs 604 that pertain to the vendors' particular interests.

According to another method of enabling vendors to become notified of relevant RFXs, the commerce system 100 automatically performs vendor notification preferably using a daily batch process performed by the batch module 216 discussed above. In this 100 method, the commerce system 100 scans the database 110 for just Released RFXs 606, that is, document records corresponding to a particular Status field value. The system also scans for vendors that have registered themselves in the database 110 with a particular profile of agencies for which those vendors have a business interest and commodities, preferably based on the

five-digit NIGP code (but without the additional five-digit 1 5 tailoring developed by the procuring agencies) 608. The system then filters the set of vendors according to their profiles and the basic NIGP code specified in the RFXs to determine the subset of vendors that will receive a notification regarding a particular RFX 610. The buyers for the procuring agencies cannot exclude or include particular vendors from receiving the notification. Thus, each just-released RFX has its subset of vendors that receive a notification. The commerce system 1 00 then sends an HTML-rich e-mail to the determined subset of vendors 612, enabling a prompt and data-specific response from the vendors.

. Preferably, the system 100 allows buyers to amend the RFXs after their release to the Internet. To effectively amend an RFX, the system 100 automatically transmits e-mail to all vendors that received the original RFX. Preferably, registered vendors receive the amendment, which includes the updated and complete RFX and a section indicating the reasons for the amendment including the changes from the original RFX. With respect to non-registered vendors, the system 100 identifies and records in a download tracking file those vendors that previously accessed the original RFX. Preferably, these non-registered vendors are notified by e-mail that an amendment has been made. More generally, agency buyers may access, for status and other reasons, the data in the download-tracking file on vendors (registered and non-registered) that have downloaded released RFXs.

The system also provides buyers with the ability to communicate with vendors directly according to desired groupings. Buyers may e-mail vendors according to a particular solicitation that selected vendors received, by registered commodity, by type of vendor, by vendor in a particular city, state or zip code, and/or any other criteria that distinguishes vendors from each other. Alternatively, the system allows buyer and others to create and define customized groupings of vendors and others. Such groupings may be established for purposes of solicitation, communication, comparative analysis, etc.

FIG. 7 depicts the process by which vendors respond to a notification of an RFX according to the batch processing 216 discussed above and by which an award is issued by 1 0 the procuring organization. First, with the receipt of the e-mail notification, the vendor completes a response data page 700. Preferably, this page prompts the vendor to enter a price for the goods or services requested and any comment that the vendor desires to include regarding any desired transaction terms. Once the response page is completed, the vendor can submit the data as its bid. Moreover, each time that the vendor logs into the 5 system, the system scans the vendor's RFX response file and enables the vendor to modify or remove any bids it has submitted. The commerce system transmits the data to the central database 702. By requiring responses in this manner, the commerce system 1 00 implements a blind bidding system that vendors normally must adhere to in dealing with public agencies. The vendor response data is then stored in an RFX Response Detail record, which collects all of the vendor responses 704. This new record is linked with the original REX record by the original RFX record reference number. This record will continue to store vendor responses until the bidding closing date specified in the original RFX record. This function is performed as part of the batch process 216. The batch process 216 scans the bid closing dates for all of the commerce system's released RFXs, and then changes the Status field value for such released RFXs when the time for bidding becomes closed 706. By changing the Status field value, a released RFX record becomes a Closed RFX Awaiting Award. Optionally, the buyer for the RFX can scan the database for RFX record Status fields with values corresponding to a closed RFX 708. Software tools associated with the Agency Buyer module 212 enable the buyer to have the commerce system scan and list, on a line item basis, the RFXs that await award. The buyer can then select an RFX to examine. The buyer can then scan the finalized RFX Response Detail Record corresponding to a particular RFX record. The buyer has the option of viewing the vendor responses, including vendor

line item instructions and comments, scanning the database for the award history corresponding to a particular vendor that responded, and sending a personalized e-mail to a vendor contact. The buyer preferably can list the vendors according to different aspects of their responses including the price quoted per unit of measure for the goods.

After the buyer reviews the vendor responses and optionally, any data on the vendors compiled in the database I 10 that the buyer chooses to examine, the system enables the buyer to electronically select an awardee from the vendors listed in the RFX Response Detail Record 710. The award can be limited to a particular line item of goods I 0 or simply a portion of the total quantity for an item on the RFX. When the buyer selects an awardee, the commerce system 100 creates a Purchase Order (P.O.) Detail Record that is linked by reference number to the original RFX record 712. With the creation of this record, the commerce system 100 sends the buyer an award data entry page, the entered data to be stored in this new record. Preferably, the buyer can enter various kinds of 1 5 information regarding the award including whether the item to be procured is taxable or not, and if it is taxable, the buyer may specify the appropriate tax rate. The buyer preferably can also attach a file and may add comments that are internal to the agency. For example, if the buyer selected a vendor that did not have the lowest bid, the system preferably requires a statement regarding the buyer's decision that is stored in the system.

In this way, the commerce system polices against favoritism by individuals within a procuring organization for certain vendors.

The commerce system 100 also enables the buyer to add new instructions regarding the line item of goods or all the goods. If the award for a particular vendor does not cover all of the goods in the RFX, then the commerce system enables the buyer to split the award between different vendors based on quantity or item 716. Under those circumstances, additional P.O. Detail records are created by the system for each vendor 718. A P.O. Detail record is created for each new vendor that is awarded a portion of the set of goods listed in the RFX.

Once a P.O. Detail record is completed for a vendor the system preferably enables a buyer to undo the award 720 or save the award. Although the buyer can return to create additional awards for additional vendors based on the same RFX, once the data entry for a first awardee is completed, the system creates a P.O. Header record 722. This header record concerns data that is general to the award to a particular vendor. Thus, the system sends the buyer an additional page for award data entry in the P.O. Header Record, if necessary 724. The data that the buyer enters preferably includes a lag time for the release of the award and/or purchase order, an award type, such as for example, whether the delivery is definite or indefinite, and comments regarding the basis of the award. The buyer can preferably enter the type of competition, that is, whether it was open, limited or sole source, notes on why a non-low bid was awarded, general P.O. comments, other notes for internal personnel, and who will be the signatory/ for the purchase order. The buyer may also optionally attach a file to the P.O. Header Record. Also, at any time, the buyer I 0 can save the data and return later to the record or cancel the data entries entirely.

Once the P.O. Header record is completed for an RFX, the system preferably enables the buyer to complete the total award 726 or undo the award 728. If the buyer chooses to complete the award, the commerce system preferably saves the data in a new record called an Award record 730. Optionally, the system may provide for a purchase 5 order approval route 729 similar to the approval route required for a request document or an RFX as shown in FIG. 3. However, once the award is completed, the original RFX record is preferably no longer viewable by the vendors on the system, as the processing by the commerce system of the original RFX becomes complete. The Award record holds all of the P.O. Header records pertaining to the original RFX. Furthermore, the commerce system 100

modifies the Status field in each of the P.O. Header records from an award in progress to a completed award 732. By doing so, access by vendors to the terms of the completed award is enabled. By so changing the Status field, the completed award is effectively posted in the Internet for viewing by all vendors on the commerce system I 00.

Finally, the commerce system preferably e-mails the P.O.s to the awardees and e-mails interested vendors about the award, including the identity of the awardees and the accepted price 734. The commerce system I 00 preferably provides the capability for a hard copy of the purchase order to be printed and delivered to the awardees, if necessary. Once the procuring agency receives the goods from the vendors, the commerce system 100 provides the capability of entering data in the P.O. Header record regarding vendor performance in its delivery of the goods, the quality of the goods or services, etc.

Over time, historical data on vendor performance in dealing with a particular procuring agency is generated. This data can be compiled and used as a decision tool when new awards are considered. Under certain circumstances, vendor performance data across multiple procuring agencies can be compiled and shared by procuring agencies. The advantage of such sharing of data is that perhaps a clearer picture of a vendor's overall performance is produced.

Although the invention has been described with reference to preferred embodiments, it will be readily appreciated by those of ordinary skill in the art that many modifications and adaptations of the invention are possible without departure from the spirit and scope of the invention.

Claim

- 1 A system for generating a request for a commodity for processing by a buyer, the system comprising:
 - (a) a requester terminal for inputting request data relating to the request;
 - (b) a memory for storing an approval route map comprising data fields specifying potential buyers for processing the request;
 - (c) a processor for accessing the request data and the approval route map and for identifying therefrom the buyer to process the request;
 - (d) a buyer terminal for receiving the request data; and
 - I 0 (e) a communication link providing communication between the processor, the requester terminal and the buyer terminal.
- 2 The system of claim 1, the approval route map being specific to the requester. 3 . The system of claim 1, the request data including a commodity type for the 1 5 commodity requested, and the processor using the commodity type to at least in part identify the buyer processing the request.
- 4 The system of claim 1, the request data including a quantity value for the commodity requested, and the processor using the quantity value to identify the buyer processing the request.
- 5 The system of claim 1, the request data including a price for the commodity requested, and the processor using the price to identify the buyer processing the request.
- 6 A method of requesting a commodity through a buyer comprising the steps of:
 - (a) inputting request data relating to a request regarding the commodity;
 - (b) electronically determining the identity of the buyer using the request data and an approval route map; and
 - (c) electronically notifying the buyer about the request.
- 7 The method of claim 6 further comprising a step between step (c) and

(d) of(c 1) notifying an approver of the request according to an approval route map in the server; and
(c2) notifying a requester of a decision on the request when the approver acts on the request.

8 The method of claim 6, the request data comprising header information and information relating to the commodity.

9 The method of claim 6, the request data including a commodity type for the commodity requested, and the identity of the buyer processing the request being determined in part by using the commodity type.

10 The method of claim 6, the request data including a quantity value for a commodity requested, and the identity of the buyer processing the request being determined in part by using the quantity value. 1 5 11. The method of claim 6, the request data including a price for the commodity requested, and the identity of the buyer processing the request being determined in part by using the price.

12 A system for processing requests for a commodity into an RFX for viewing

by one or more vendors, the system comprising:

(a) a memory for storing a request as request data in procurement data fields; (b) a processor for modifying the request data in a procurement status field of

the procurement data fields to reflect a status of the request;

(c) a buyer terminal for inputting RFX data regarding the RFX in RFX fields

of the procurement data fields;

(d) a vendor terminal representing at least one vendor for outputting the RFX data; and

(e) a network electronically linking the processor, the buyer terminal, and the at least one vendor terminal for releasing the RFX data to the at least one vendor terminal.

13 The system of claim 12, the processor modifying the request data in a current handler field of the procurement data fields according to an approval route map in the memory to reflect an approval status of the RFX.

14 The system of claim 12, the processor providing notification if the commodity specified in the request is in a class shared by a commodity specified in other requests that await being released to the network.

15 The system of claim 14, the processor providing notification if the request specifies a quantity of the commodity that, in sum with quantities specified in the other requests, exceeds a predetermined threshold quantity level. I 0 16. The system of claim 12, the processor providing notification if the request specifies a quantity of the commodity that exceeds a predetermined threshold quantity level when the quantity is summed with quantities specified in other requests that further specify a commodity in a class shared by the commodity specified in the request and that await being released to the network. 1 5 17. A method of processing requests for a commodity into an RFX for viewing by one or more vendors, the method comprising the steps of

(a) providing a request as request data in procurement data fields of a processor-accessible memory;

(b) automatically modifying the request data in a procurement status field of

the procurement data fields to reflect approval of the request;

(c) inputting RFX data regarding the RFX in RFX fields of the procurement data fields;

(d) releasing the RFX data to an electronic network accessible to the one or

more vendors; and

(e) modifying the procurement status field to reflect the release of the RFX data to the network.

18 The method of claim 17 further comprising steps between steps (c) and (d)

of:

(c 1) automatically notifying an approver concerning the RFX according to an

approval route map; and

(c2) automatically notifying a buyer concerning a decision on the RFX when the approver acts on the RFX.

19 The method of claim 17 further comprising a step of automatically providing notification if the commodity specified in the request is in a class shared by commodities specified in other requests that await being released to the network.

20 The method of claim 19 further comprising a step of automatically providing notification if the request specifies a quantity that, in sum with quantities specified in the other requests, exceeds a predetermined threshold quantity level.

21 The method of claim 17 further comprising a step of automatically providing notification if the request specifies a quantity of the commodity that exceeds a predetermined threshold quantity level when the quantity is summed with quantities specified in other requests that further specify commodities in a class shared by the commodity specified in the request and that await being released to the network.

22 The method of claim 17 further comprising a step of notifying a requestor of a decision on the request if a buyer acts on the request.

23 A system for enabling the generation of a procurement award from a released RFX to a vendor of commodities to receive the procurement award, the system comprising:

(a) at least one vendor terminal for submitting bids on the released RFX;

(b) a buyer terminal for collecting bids to the released RFX from at least one potential vendor, selecting the vendor to receive the procurement award from among the at

least one potential vendor, and entering purchase order data;

(c) a processor for modifying RFX data in an RFX status field of an RFX data record to reflect when bidding on the RFX is closed and when the procurement award is issued; and

(d) a memory for storing purchase order data in a purchase order record linked to the RFX data record.

24 The system of claim 23, the processor requiring an input of a comment regarding the award when the vendor to receive the procurement award does not have a bid that is lowest of the collected bids.

25 The system of claim 23, the processor notifying the at least one potential vendor of the issuance of the award, including the identity of the vendor to receive the procurement award and the purchase order data.

26 A method of enabling the generation of a procurement award from a released RFX to a vendor of a commodity to receive the procurement award, the method comprising the steps of

(a) electronically collecting bids to the released RFX from at least one potential vendor;

(b) modifying RFX data in an RFX status field of an RFX data record at a vendor bid closing time for the RFX to reflect that the RFX is closed; (c) electronically selecting the vendor from among the at least one potential

vendor to receive the procurement award;

(d) entering purchase order data into a purchase order record linked to the RFX data record; and
(e) modifying the RFX status field to reflect issuance of the award to the vendor.

27 The method of claim 26 further comprising the step of automatically requiring an input of a comment regarding the award when the vendor to receive the procurement award does not have a bid that is lowest of the collected bids.

28 The method of claim 26 further comprising the step of automatically notifying the at least one potential vendor of the issuance of the award, including the identity of the vendor to receive the procurement award and the purchase order data.

29 A system for generating a request of a buyer, the system comprising:
(a) a requester terminal for inputting request data relating to the request;
(b) a memory for storing an approval route map comprising data fields specifying potential buyers for processing the request;
(c) a processor for accessing the request data and the approval route map from the memory and for identifying therefrom the buyer to process the request;
(d) a buyer terminal for receiving the request data; and
(e) a communication link providing communication between the processor, the requester terminal and the buyer terminal. 10 30. A method of requesting a commodity through a buyer comprising the steps of (a) inputting request data relating to a request regarding the commodity; (b) electronically identifying the buyer using the request data and an approval route map; and

15 (c) electronically notifying the buyer of the request.

31 A system for sending requests for a commodity to one or more vendors, the system comprising:
(a) a memory for storing a request as request data;
(b) a processor for modifying the request data to reflect a status of the request;
(c) a buyer terminal for inputting RFX data regarding the request;
(d) a vendor terminal for outputting the RFX data; and
(e) a network electronically linking the processor, the buyer terminal, and the vendor terminal for sending the RFX data to the vendor terminal.

32 A method of sending requests for a commodity to one or more vendors, the method comprising the steps of
(a) providing a request as request data;
(b) modifying the request data to reflect approval of the request;
(c) adding RFX data to the request data regarding the request;
(d) sending the RFX data to the one or more vendors; and
(e) modifying the request data to reflect transmission of the RFX data to the one or more vendors.

33 A system for generating a procurement award to a vendor, the system comprising:
(a) a vendor terminal for submitting bids on an RFX;
(b) a buyer terminal for collecting bids on the RFX, selecting the vendor to receive the procurement award, and entering purchase order data;
(c) a processor for modifying RFX data to reflect when bidding on the RFX is closed and when the procurement award is issued; and
(d) a memory for storing purchase order data linked to the RFX data.

34 A method for generating a procurement award to a vendor, the method

comprising the steps of-

- (a) electronically collecting bids to an RFX;
- (b) modifying RFX data at a vendor bid closing time for the RFX to reflect that the RFX is closed;
- (c) electronically selecting the vendor to receive the procurement award;
- (d) entering purchase order data linked to the RFX data; and
- (e) modifying the RFX data to reflect issuance of the award to the vendor.

AMENDED CLAIMS

[received by the International Bureau on 27 Septembre 2000 (27 00);
new claims 35 to 37 added; remaining claims unchanged (1 page)]

35 The method of claim 8 wherein the information relating to the commodity is derived from a tailored commodities catalog specific to an agency and existing oil a

i
single database shared by a plurality of agencies.

36 The system of claim 12, the processor filtering a set of at least one vendor according to a vendor profile and the commodity specified, whereby the buyer is precluded from choosing the at least one vendor.

37 The method of claim 17 wherein the step of releasing the RFX data to an electronic network accessible to the one or more vendors precludes the buyer from choosing the one or more vendors.
